Alpha Lattice Design Analysis

In the CIMMYT Maize Program, alpha (0.1) lattice designs have been used since 1986 for evaluating groups of more than 200 genotypes, generally planted in single row plots. Relative efficiencies of 1.0-2.0 have been observed, but the use of the alpha-lattice designs has thus far been restricted mainly to genotype evaluation trials.

Alpha Lattice Designs (1) These are incomplete block designs (sometimes balanced) that are . resolvable. Resolvable: Incomplete blocks group together into "super-blocks" that are complete. How to analyse the data from alpha lattice design?,

Use of an alpha-lattice design in 714 international yield trials of barley, durum wheat and bread wheat in 1990/91 to 1992/93 resulted in an average efficiency 18% higher than the randomized complete block design when average variance was used as the comparison criterion.

Efficiency of alpha-lattice designs in international ...

Alpha-lattice designs Genotypes are distributed among the blocks so that all pairs occur in the same incomplete-block in nearly equal frequency. The design permits removal of incomplete-block effects from the plot residuals and maximizes the use of comparisons between genotypes in the same incomplete-block.

The instant results suggest that Alpha lattice Design must be used in field experiments because it provides smaller standard errors of differences, coefficients of variation and error mean squares as compared to RCBD. However to evaluate its wider applicability, more experiments must be conducted through-out the country.

i. The layout and analysis of this design are more complicated as compared to that of RBD and LSD. ii. This design provides lesser degrees of freedom for the estimation of error variance than RBD. Uses: i. This design is useful when all the factors are not of equal importance, i.e., some of them require larger plots and others require smaller plots. ii.

efficient alpha lattice design to a RCBD. If the value of relative efficiency is greater than 1 then the alpha lattice results in a smaller error variance than RCBD and it adjusts genotype means for block effects. In addition to that the relative efficiency is less than 1.0, Alpha lattice design is less efficient than the RCBD.
