Equilibrium occurs when the rates of the forward and reverse reactions are exactly equal rate forward = rate reverse Reaction rate is the number (mol) of molecules produced or consumed $\frac{d[\text{product}]}{dt}$ in a chemical reaction per reaction volume (L) $\frac{d[\text{reactant}]}{dt}$ per time (s) rate forward rate 29 forward

Introduction to Kinetics and Equilibrium

A reversible chemical reaction is in chemical equilibrium when the rate of its forward reaction equals the rate of its reverse reaction and the concentrations of its products and reactants remain unchanged. The chemical equation for the reaction at equilibrium is written using double arrows to indicate the overall reversibility of the reaction.
