expansion of air or other gas (the working fluid) at different temperatures, such that there is a net conversion of heat energy to mechanical work. More specifically, the Stirling engine is a closed-cycle regenerative heat engine with a permanently gaseous working fluid

Stirling engine - Wikipedia

Stirling engines don't have an exhaust (from inside the engine) because the working gas is used again and again in every cycle. Of course, Stirling engines can be heated by flame heaters (or any other form of heat). If the Stirling engine is designed to use flames to heat the hot side, the heater will certainly have an exhaust.

Stirling engines have been used in a variety of forms since the 1930s as motive power in a range of vehicles and engines of 75kW and more have been developed. Although early engine developments were for automotive use, because of its low specific power the Stirling engine is better suited for stationary applications and recent years have seen it used more for generating electrical energy.

The Stirling Engine

A Stirling engine is a heat engine that works on the basis of an external applied temperature difference. By maintaining a hot and cold temperature difference the engine is able to run and produce mechanical power.

Problems

A Stirling engine is a specific flavor of heat engine formulated by Robert Stirling in 1816; this means it can transform the flow of heat into mechanical work (such as spinning a crankshaft). The key term is “flow of heat”; there must be two “reservoirs” that are separated, and these reservoirs must be at different temperatures in order for this flow to take place between them.

Thermodynamic Theory of the Ideal Stirling Engine

The Stirling engine is a closed cycle heat engine. It is typically completely sealed from the outside environment and works on the expansion and compression of the gas (typically air) that's enclosed in the sealed engine.

uses one or more pistons to achieve useful work through some input of heat from an external source. They differ vastly from internal combustion engines that are seen in most vehicles. Stirling engines use the same gas over and over, unlike internal combustion engines which constantly intake and exhaust the gas.
